Using the `ccg-latex.sty` file   Cem Bozşahin   June 7, 2021

Include this line somewhere in the latex preamble:

`\usepackage{ccg-latex}`

I will show examples with increasingly high-level ccg-latex code, from lowest level `\cgex` to `\begin{ccg}` and `\begin{ccgg}`.

Examples with the `\cgex{n}{derivations}` command. The `\lf{}` is already in math mode. Lexical assumption lines are drawn by one command.

$$\frac{\dfrac{\text{John}}{\begin{array}{c}S/(S\backslash NP)\\:\lambda p.p\,john'\end{array}}\quad \dfrac{\dfrac{\text{likes}}{\begin{array}{c}(S\backslash NP_{3s})/NP\\:\lambda x\lambda y.like'xy\end{array}}\quad \dfrac{\text{Mary}}{\begin{array}{c}(S\backslash NP)\backslash((S\backslash NP)/NP)\\:\lambda p.p\,mary'\end{array}}}{S\backslash NP:\lambda y.like'mary'y}{\scriptstyle <}}{S:like'mary'john'}{\scriptstyle >}$$

The ccg-latex code is:

```
\cgex{3}{John & likes & Mary\\
\cglines{3}\\
\cgf{S\fs(S\bs NP)} & \cgf{(S\bs\cgs{NP}{3s})\fs NP}
  & \cgf{(S\bs NP)\bs((S\bs NP)\fs NP)}\\
\lf{\lambda p.p\,\so{john}}
& \lf{\lambda x\lambda y.\so{like}xy} & \lf{\lambda p.p\,\so{mary}}\\
&\cgline{2}{\cgba}\\
&\cgres{2}{S\bs NP \lf{\lambda y.\so{like}\so{mary}y}}\\
% note that \cgres is by default in \cgf font
\cgline{3}{\cgfa}\\
\cgres{3}{S \lf{\so{like}\so{mary}\so{john}}}
}
```

Same example with lower-level ccg-latex commands for lexical assumption lines, and with shorthanded type-raising notation using subscript and superscript. NB. they are typeset in math mode without needing $..$.

$$\frac{\dfrac{\text{John}}{NP^{\uparrow}_{3s} : \lambda p.p\,john'} \quad \dfrac{\text{likes}}{(S\backslash NP_{3s})/NP : \lambda x\lambda y.like'xy} \quad \dfrac{\text{Mary}}{S\backslash(S/NP) : \lambda p.p\,mary'}}{\dfrac{S/NP : \lambda x.like'x\,john'}{\qquad S : like'mary'john' \qquad}{}^{>}}{}^{>\mathbf{B}}$$

The ccg-latex code is:

```
\cgex{3}{John & likes & Mary\\
% uses the alias \cat rather than \cgf above--same result
\cgul & \cgul & \cgul\\
 % manually repeats the columns for comparison with \cglines above
\cat{\cgss{NP}{3s}{\uparrow}}
& \cat{(S\bs\cgs{NP}{3s})\fs NP} & \cat{S\bs(S\fs NP)}\\
\lf{\lambda p.p\,\so{john}}
& \lf{\lambda x\lambda y.\so{like}xy} & \lf{\lambda p.p\,\so{mary}}\\
\cgline{2}{\cgfc}\\
\cgres{2}{S\fs NP \lf{\lambda x.\so{like}x\so{john}}}\\
% note that \cgres is by default in \cgf font
\cgline{3}{\cgfa}\\
\cgres{3}{\cat{S} \lf{\so{like}\so{mary}\so{john}}}
% using \cat inside \cgres is nae problem
}
```
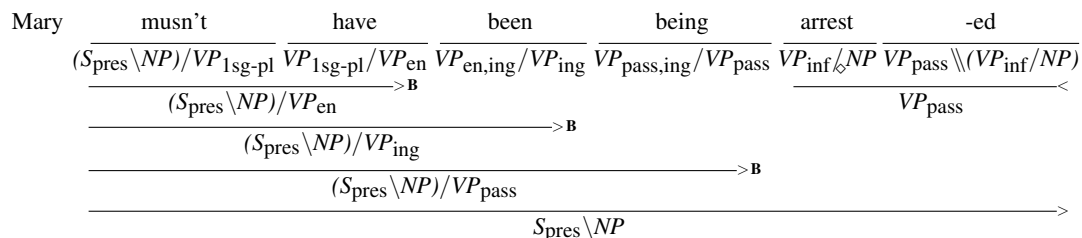

An example with double slashes (for morphology, etc.)

$$\frac{\overbrace{VP_{\text{inf}}/NP\colon \lambda x \lambda y.\textit{dismiss}'\,x\,y}^{\text{dismiss}} \quad \overbrace{((S\backslash NP_{\text{agr}})/NP)\backslash\backslash(VP_{\text{inf}}/NP)\colon \lambda p \lambda x \lambda y.\textit{past}'(P\,xy)}^{\text{-ed}}}{(S\backslash NP_{\text{agr}})/NP\colon \lambda x \lambda y.\textit{past}'(\textit{dismiss}'\,x\,y)}{}_{<}$$

ccg-latex code (using `\cgf` instead of `\cat`, which do the same, and native latex math for LF, which does the same as `\lf{..}`). NB. empty subscripts, if you feel like it, or if you keep changing the categories as I do).

```
\cgex{3}{dismiss& -ed\\
\cglines{2}\\
\cgf{\cgs{VP}{inf}\fs\cgs{NP}{}
$:\lambda x\lambda y.\so{dismiss}\,x\,y$}&
\cgf{((\cgs{S}{}\bs\cgs{NP}{agr})\fs NP)\bss(\cgs{VP}{inf}\fs NP)
$:\lambda p\lambda x\lambda y.\so{past}(P\,xy)$}\\
\cgline{2}{\cgba}\\
\cgres{2}{\cgf{(\cgs{S}{}\bs\cgs{NP}{agr})\fs\cgs{NP}{}
$:\lambda x\lambda y.\so{past}(\so{dismiss}\,x\,y)$}}
}
```
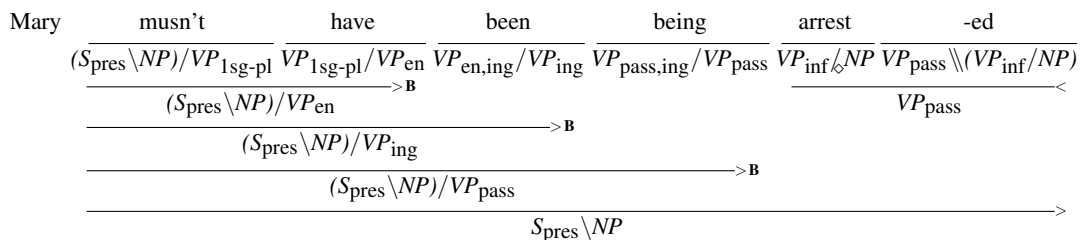

Here is one example with features galore, from Emmon Bach:

$$\frac{\text{Mary} \quad \overline{\text{musn't}} \quad \overline{\text{have}} \quad \overline{\text{been}} \quad \overline{\text{being}} \quad \overline{\text{arrest}} \quad \overline{\text{-ed}}}{\cdots}$$

Mary	musn't	have	been	being	arrest	-ed

$(S_{\text{pres}}\backslash NP)/VP_{\text{1sg-pl}}$ $VP_{\text{1sg-pl}}/VP_{\text{en}}$ $VP_{\text{en,ing}}/VP_{\text{ing}}$ $VP_{\text{pass,ing}}/VP_{\text{pass}}$ $VP_{\text{inf}}\diagdown NP$ $VP_{\text{pass}}\backslash\backslash(VP_{\text{inf}}/NP)$

$\frac{\qquad\qquad}{VP_{\text{pass}}}$ <

$\frac{(S_{\text{pres}}\backslash NP)/VP_{\text{en}}}{}$ >**B**

$\frac{(S_{\text{pres}}\backslash NP)/VP_{\text{ing}}}{}$ >**B**

$\frac{(S_{\text{pres}}\backslash NP)/VP_{\text{pass}}}{}$ >**B**

$\frac{S_{\text{pres}}\backslash NP}{}$ >

ccg-latex code:

```
{\footnotesize
Mary \cgex{6}{musn't & have & been & being & arrest & -ed\\
  \cglines{6}\\
  \cgf{(\cgs{S}{pres}\bs NP)\fs\cgs{VP}{1sg-pl}}
  & \cgf{\cgs{VP}{1sg-pl}\fs\cgs{VP}{en}}
  &\cgf{\cgs{VP}{en,ing}\fs\cgs{VP}{ing}}
  &\cgf{\cgs{VP}{pass,ing}\fs\cgs{VP}{pass}}
  &\cgf{\cgs{VP}{inf}\fds NP}
  &\cgf{\cgs{VP}{pass}\lds(\cgs{VP}{inf}\fs NP)}\\
  \cgline{2}{\cgfc}  &&&\cgline{2}{\cgba}\\
 \cgres{2}{(\cgs{S}{pres}\bs NP)\fs\cgs{VP}{en}}
 &&&\cgres{2}{\cgs{VP}{pass}}\\
  \cgline{3}{\cgfc}\\
 \cgres{3}{(\cgs{S}{pres}\bs NP)\fs\cgs{VP}{ing}}\\
 \cgline{4}{\cgfc}\\
 \cgres{4}{(\cgs{S}{pres}\bs NP)\fs\cgs{VP}{pass}}\\
 \cgline{6}{\cgfa}\\
 \cgres{6}{\cgs{S}{pres}\bs NP}
}}
```

Same example with `\begin{ccg}{n}{data}{derivations}\end{ccg}`.
No gloss line on top, and lexical assumption lines are drawn by default.

$$\frac{\text{Mary}}{} \quad \frac{\text{musn't}}{(S_{\text{pres}}\backslash NP)/VP_{\text{1sg-pl}}} \quad \frac{\text{have}}{VP_{\text{1sg-pl}}/VP_{\text{en}}} \quad \frac{\text{been}}{VP_{\text{en,ing}}/VP_{\text{ing}}} \quad \frac{\text{being}}{VP_{\text{pass,ing}}/VP_{\text{pass}}} \quad \frac{\text{arrest}}{VP_{\text{inf}}\backslash\!\!\!\diagup NP} \quad \frac{\text{-ed}}{VP_{\text{pass}}\backslash\backslash(VP_{\text{inf}}/NP)}$$

ccg-latex code:

```
{\footnotesize
Mary
\begin{ccg}{6}{musn't & have & been & being & arrest & -ed}
  {
  \cgf{(\cgs{S}{pres}\bs NP)\fs\cgs{VP}{1sg-pl}}
  & \cgf{\cgs{VP}{1sg-pl}\fs\cgs{VP}{en}}
   &\cgf{\cgs{VP}{en,ing}\fs\cgs{VP}{ing}}
   &\cgf{\cgs{VP}{pass,ing}\fs\cgs{VP}{pass}}
   &\cgf{\cgs{VP}{inf}\fds NP}
   &\cgf{\cgs{VP}{pass}\lds(\cgs{VP}{inf}\fs NP)}\\
   \cgline{2}{\cgfc}  &&&\cgline{2}{\cgba}\\
 \cgres{2}{(\cgs{S}{pres}\bs NP)\fs\cgs{VP}{en}}
&&&\cgres{2}{\cgs{VP}{pass}}\\
   \cgline{3}{\cgfc}\\
 \cgres{3}{(\cgs{S}{pres}\bs NP)\fs\cgs{VP}{ing}}\\
 \cgline{4}{\cgfc}\\
 \cgres{4}{(\cgs{S}{pres}\bs NP)\fs\cgs{VP}{pass}}\\
 \cgline{6}{\cgfa}\\
 \cgres{6}{\cgs{S}{pres}\bs NP}
}
\end{ccg}
}
```

Another example, to show glossing in the beginning. The end gloss is typeset by \mc, for multi-column, centered.

It uses \begin{ccgg}{n}{data}{gloss}{derivations}\end{ccgg}.

$$
\frac{
\begin{array}{cc}
\dfrac{\text{ver-dir}}{\text{give-caus}} & \dfrac{\text{-t}}{\text{-caus}} \quad \dfrac{\text{-ti.}}{\text{-past}}
\end{array}
}{}
$$

$VP_{\text{inf}}\backslash NP_{\text{dat}}\backslash NP_{\text{dat}}\backslash NP_{\text{acc}}$	$(S\backslash NP_{\text{nom}}\backslash NP_{\text{case}})\backslash VP_{\text{inf}}$
$:\lambda x\lambda y\lambda z.give'yxz$	$:\lambda p\lambda x\lambda y.cause'(px)y$

$$
\frac{}{\begin{array}{c} S\backslash NP_{\text{nom}}\backslash NP_{\text{dat}}\backslash NP_{\text{dat}}\backslash NP_{\text{dat}}\backslash NP_{\text{acc}} \\ :\lambda x_1\lambda x_2\lambda x_3\lambda x_4\lambda x_5.cause'(cause'(give'x_1x_2x_3)x_4)x_5 \end{array}}{}{<_{\mathbf{B}^3}}
$$

'made to let give', from Turkish

ccg-latex code:

```
\begin{ccgg}{3}{ver-dir & -t & -ti.}{give{-caus} & {-caus} & {-past}}
{
\cgf{\cgs{VP}{inf}\bs\cgs{NP}{dat}\bs\cgs{NP}{dat}\bs\cgs{NP}{acc}}
& \cgf{(S\bs\cgs{NP}{nom}\bs\cgs{NP}{case})\bs\cgs{VP}{inf}}\\
\lf{\lambda x\lambda y\lambda z.\so{give}yxz}
& \lf{\lambda p\lambda x\lambda y.\so{cause}(px)y}\\
\cgline{2}{\cgbc$^3$}\\
\cgres{2}{S\bs\cgs{NP}{nom}\bs\cgs{NP}{dat}\bs\cgs{NP}{dat}
\bs\cgs{NP}{dat}\bs\cgs{NP}{acc}}\\
\cgres{2}{\lf{\lambda x_1\lambda x_2\lambda x_3\lambda x_4\lambda x_5.
\so{cause}(\so{cause}(\so{give}x_1x_2x_3)x_4)x_5}}\\[1ex]
\mc{3}{'made to let give', from Turkish}
}
\end{ccgg}
```
